Audit a Text-to-SQL harness before you retrain

A short audit of your evaluation harness, to run before you spend anything on retraining.

- [ ] 01 150 to 300 real questions, asked by analysts in the course of work
- [ ] 02 Two annotators and one written policy
- [ ] 03 Treat the questions where the annotators disagree as the specification your harness is missing
- [ ] 04 Build test pairs from those disagreements

> WHY IT MATTERS
>
> *End-to-end accuracy conflates two specification failures with different fixes. Most Text to SQL evaluation harnesses score correct queries as wrong because nobody wrote down what correct means.*

From: *Your Text to SQL Model Didn't Fail. Your Evaluation Metric Did.*
